Group Reflection:

During this lab, we learned how to create and organize an Agile backlog in Jira using Epics and User Stories. We prioritized the user stories based on their importance and assigned Story Points using the Fibonacci sequence. We also learned how Planning Poker can be used for estimation.

We created and simulated a Sprint by moving user stories through To Do → In Progress → Done and added comments to track progress. The Burndown Chart helped us understand the amount of work completed and the work remaining during the sprint. Overall, this lab helped us understand how Agile Scrum practices can be applied using Jira for managing software development work.

4. ANSWERS

1. Did your estimations reflect the actual effort?

My estimations were reasonably close to the actual effort. Most tasks were completed within their estimated story points, although some tasks required slightly more effort than expected. This helped me understand the importance of considering task complexity when estimating.

2. Was your backlog well-prioritized?

Yes, I prioritized the backlog based on the importance of the features. I focused on the core cloud cost management and optimization features first, followed by the less critical features.

3. How did your simulated sprint align with your plan?

My simulated sprints generally aligned with my original plan. I was able to organize the tasks into sprints and move them through the workflow from **To Do** → **In Progress** → **Done**. The simulation helped me understand how sprint planning works in practice.

4. What insights did the burndown chart give about your capacity?

The burndown chart showed how my remaining story points decreased during the sprint. Since I completed the tasks progressively, it gave me an idea of how much work I could realistically handle within a sprint and helped me understand the importance of maintaining a consistent pace.
